

Range Data List Plug-In

March 2013

The Range Data List plug-in provides a compact column based display of user selected range data calculations. These calculations are independent of the Range Tool and no graphics are drawn, furthermore the calculations only apply to platforms. Right clicking within the dialog allows a user to manage calculation pairs and configure calculation options. Once again, only pairings between platforms are supported.

Options are saved to the system registry and should only be changed via the Range Options dialog.
